

Name: Mthobisi

Surname: Ntshangase

Student no.: 22341705

Company name: Richmond Digital Center

Day/Date	Description of the task done.
Monday	Reviewed the weekly tasks on Trello and discussed the backend and database requirements. The database team also reviewed the Figma prototype to identify the required tables and functionality.
Tuesday	Worked on certificate functionality and discussed the requirements for certificate uploads and bulk sending. The database team also continued working on the ERD in preparation for testing.
Wednesday	Reviewed the progress of the frontend, backend and database teams. Updated the database requirements for certificates, completion dates, enrolments and foreign keys, while testing outstanding system functionality.
Thursday	Continued working on the tasks identified during Wednesday's meeting. The team focused on implementing database and certificate changes and testing the outstanding functionality.
Friday	Reviewed the latest portal progress, including the Programmes, Analytics, Certificates, Settings, and Blogs and News pages. The team also tested backend integration, certificate functionality, and authentication features.

Explain what you learnt this week and outline any challenges that you might have encountered

This week, our team continued with the development of the **IIK Portal**, concentrating on database development, backend functionality, certificate management, frontend integration, and system testing. We started the week by checking the tasks assigned on Trello and reviewing the Figma prototype to determine the database requirements. The backend team worked on the certificate-related features, while the database team made further changes to the ERD and database to accommodate certificate numbers, completion information, certificate issue dates, enrolment details, and the necessary relationships between tables. The teams also continued improving the learner and administrator sections of the portal, including the Programmes, Analytics, Blogs and News, Settings, and Certificates pages. Different features were tested during the week to identify problems and ensure that the system was working according to the requirements. Test data was used where needed to assist with development and testing, and GitHub was used to share and combine the work completed by the different teams. By the end of the week, several areas of the portal had been improved, although some features still require additional work and testing.

One of the main difficulties experienced this week was with the certificate functionality. The team encountered problems with certificate uploads, validation, the hardcoded certificate template, and the drag-and-drop feature. There were also challenges with CAPTCHA, Google verification, and email verification. Another concern was ensuring that learners could only receive certificates for

programmes they had actually completed or enrolled in. Testing some backend features was also difficult because the latest changes had not yet been added to the main GitHub branch. Furthermore, some frontend pages were still being developed, which caused delays when testing and connecting certain system features.
